

Raising your Blind ...

(If your blind is already fully raised up skip to the 'lowering your blind section')

Step 1: Pull the **FRONT CHAIN** to start raising the blind until you start to feel some resistance, this is usually around when around 40cm of cord has come out of the mechanism. **DO NOT CONTINUE TO PULL THE CHAIN**

Step 2: Allow the cord to retract back into the gear housing then pull the chain down again, continue to raise the blind with a series of pulls each time allowing the cord to retract back into the dual rise mechanism.

Step 3: When the blind gets closer to the top lessen the amount of cord you pull out to allow you to fine tune where you want the blind to stop.

Lowering your Blind ...

Step 1: **IMPORTANT** Ensure you use the **REAR CHAIN** to lower the blind

Step 2: Again, using a series of short pulls lower your blind making sure you don't overpull the cord until the blind reaches your desired position.
