

French Pole

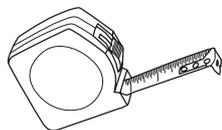

Fitting Instructions

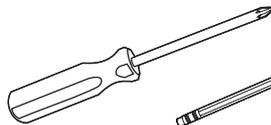

Tools you will need...

Spirit Level

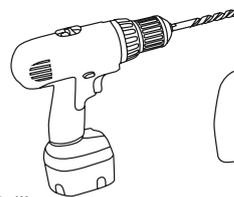

Tape Measure

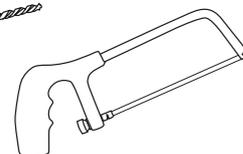

Screwdriver

Pencil

Drill

Hacksaw

how to fit your French Curtain Pole...

Step 1: As a guideline we recommend that the brackets are positioned 10cm up and 15cm out from both sides of the window frame (you may use a spirit level for accuracy). Use the centre bracket to help support the pole.

Step 2: Remove the back plates from the French Returns by loosening the grub screws and place each in turn at the height determined in Step 1. Use a pencil to mark the exact position of the screw holes that will fix them to the wall. Repeat this process for the centre bracket, evenly spacing it between the two French Returns.

Step 3: Drill into the wall at the marked positions using an appropriate drill bit for the type of wall. Insert wall plugs, ensuring they are flush with the wall. Then screw the back plate into place using the three screws provided.

Step 4: Replace the back plate cover of the centre bracket and French Returns and tighten up the grub screws.

Step 5: Check that the pole fits the window. Measure the distance between the centre point of the window and the French Return.

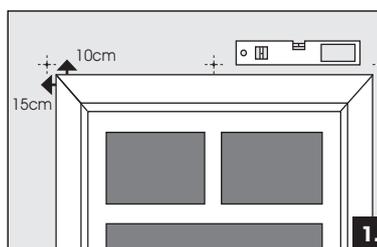

Step 6: If the pole needs to be shorter, mark the distance (L) onto the pole (if using 2 poles, ensure each pole is of equal length).

Step 7: If needed, cut the curtain pole(s) to size using a hacksaw.

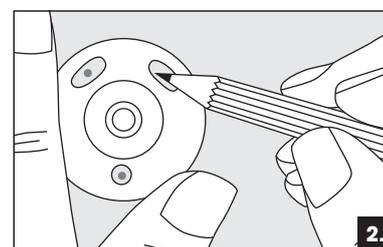

Step 8: If joining two poles together, use the pole joiner supplied to connect them.

Step 9: Place the rings, centre bracket (vertically) and French Returns onto the pole(s) before attaching the bracket and French Returns to the base plates. Ensure that the rings are split evenly in between the centre bracket and French Returns.

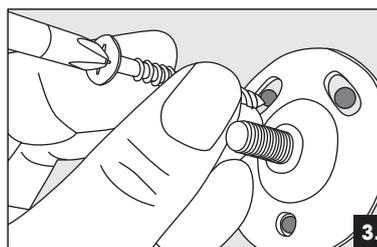

Step 10: Tighten the screws on the centre bracket and French Returns to secure all elements of the pole.
